- Modeling
- Questions

- GEOMA Network
("Rede Cooperativa de Modelagem Ambiental")

- Cooperative Network for Environmental Modeling
- Ministry of Science and Technology
- INPE/OBT, INPE/CPTEC, LNCC, INPA, IMPA, MPEG

- Long-term objectives - Phase I

- Develop computational - mathematical models to predict the spatial dynamics of ecological and socio-economic systems at different geographic scales, within the framework of sustainability
- Support policy decision making at local, regional and national levels, by providing decision makers with qualified analytical tools.
- LUCC, Data Base, Human Dimension, Wetlands, Climate, Physical processes, Biodiversity.

GEOMA Biodiversity

- Biodiversity & Conservation planning
 - Systematic Planning for Conservation
 - Species Distribution Models
 - Economic interest species Population Dynamic

ATUALIZAÇÃO DAS ÁREAS PRIORITÁRIAS PARA CONSERVAÇÃO, UTILIZAÇÃO SUSTENTÁVEL
E REPARTIÇÃO DE BENEFÍCIOS DA BIODIVERSIDADE NO BIOMA AMAZÔNIA

Biodiversity

Biological diversity or Biodiversity

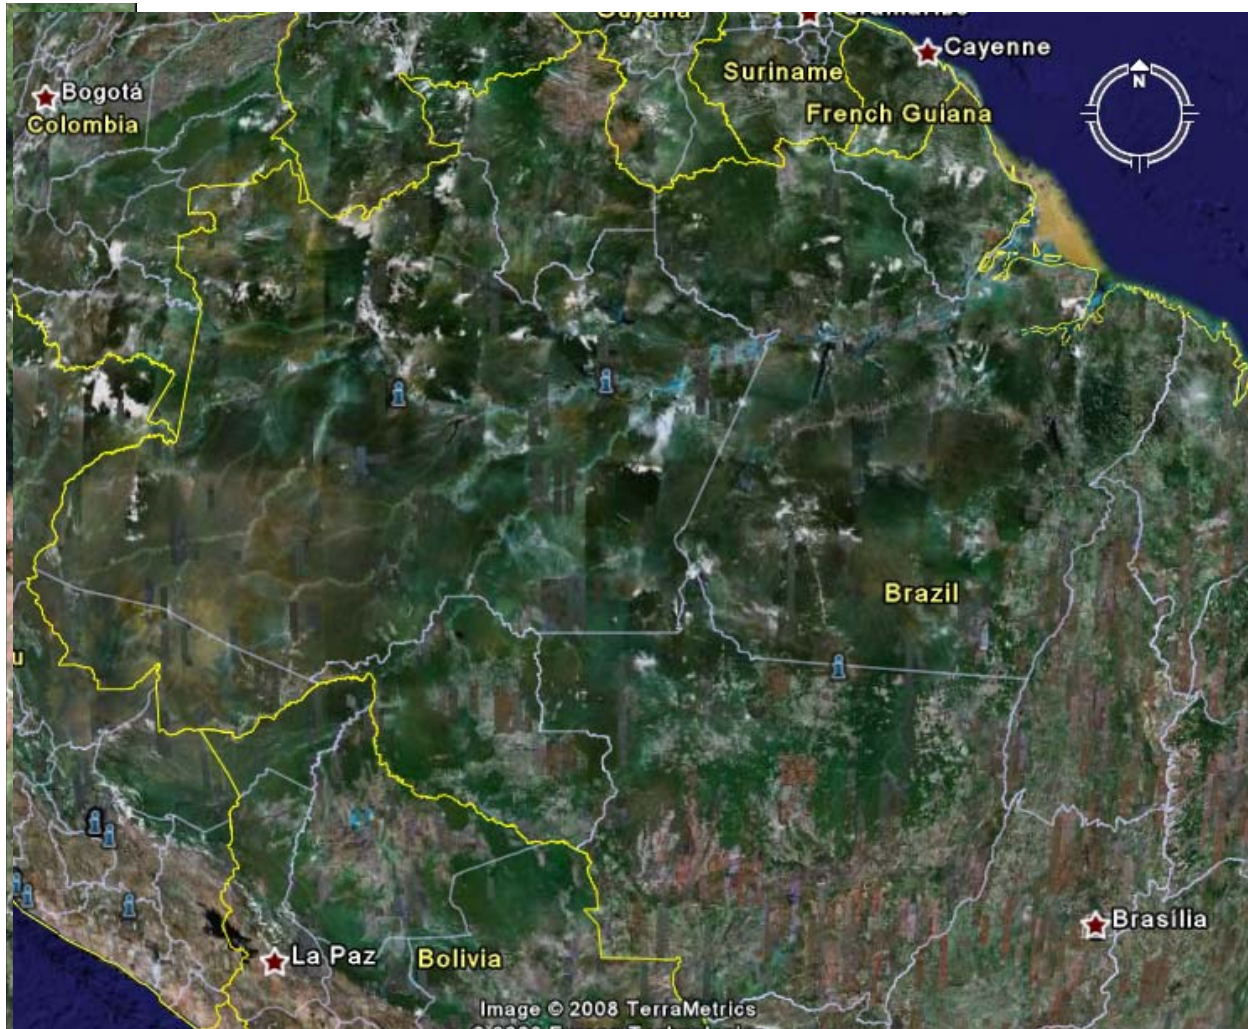

Totality of genes, species, and ecosystems of a region Or Variation of life at all levels of biological organization

- Variability of Genetic Resources
 - Economic interest
 - Human demands and presence
 - Climatic changes
-
- How to measure ?
 - Strategies for conservation?

AMAZONIA

Field Work

G...ors - INPE & IfGI Workshop

March 2009

GEOMA Biodiversity – Field Data

■ Field Work

- Madeira - Purus rivers
- BR-319 road
- Human pressure

GEOMA Biodiversity – Field Data

- **Field Work:**(23 researchers) birds, fishes, insects (bee,butterfly), arthropods (spiders), mammals, lizards, vegetation (palm trees), landscape.

GEOMA Biodiversity – Field Data

■ **Field Work:**(23 researchers) birds, fishes, insects (bee,butterfly), arthropods (spiders), mammals, lizards, vegetation (palm trees), landscape.

- Several students, thesis and papers
- Almost all \$\$ for the component
- 3 points sampled – Modeling??
- How to “extrapolate” point data (plots) for some region?
- Environmental variables could be collected at regular temporal and/or spatial base sensors (light, moisture, canopy cover, etc.) ?

Field Work - Existed data - Plots (permanents)

Welcome to the RAINFOR Website

The Amazon Forest Inventory Network is an international network that has been established to understand the biomass and dynamics of Amazonian forests. Since 2000 we have established a systematic framework for long-term monitoring of this region, which holds more biodiversity, water, and vegetation carbon, than any other region of the planet. RAINFOR has worked step-by-step, including partners across the nations of Amazon, taking account of the potentially strong modulating role of environmental variables like soil nutrition, and the need to help develop a new generation of Amazon ecologists. RAINFOR is currently supported by the Andes and Amazon Initiative of the Gordon and Betty Moore Foundation.

TROPICOS was originally created for internal research but has since been made available to the world's scientific community. All of the nomenclatural, bibliographic, and specimen data accumulated in MBG's electronic databases during the past 25 years are publicly available here. This system has over one million scientific names, 3.4 million specimen records, 111,000 bibliographic citations, and more than 70,000 images of living plants and specimens.

Please continue to use the feedback link ([Send feedback](#)) at the bottom of the pages to submit suggestions, bug reports, and feature requests. We are not able to personally respond to all of the messages, but we do our best to respond to the ones we can.

THE NEW YORK
BOTANICAL GARDEN

International Plant Science Center
The C. V. Starr Virtual Herbarium

[Science Home](#) ... [Virtual Herbarium](#) ... [Virtual Herbarium](#)

The C. V. Starr Virtual Herbarium is the electronic gateway to the collections of the William and Lynda Steere Herbarium. The goals of the Virtual Herbarium are to make specimen data available electronically for use in biodiversity research projects; to reduce shipping of actual specimens for projects where digital representations will suffice for study; and to reunite data elements (e.g., photographs and drawings, manuscripts, published works, microscopic preparations, gene sequences) derived from a specimen with the catalog record for that specimen.

The digital collections of the Virtual Herbarium, comprising approximately 1,300,000 herbarium specimens and 225,000 high-resolution specimen images, are updated daily as the Garden pursues the goal of digitizing all of its 7,300,000 plant and fungi specimens.

Additional Information

We are interested in comments from users and suggestions for additional features and functions.

GIS integration – loose coupling

The screenshot displays the TerraView 3.2.0 interface. The main map shows a geographical area of South America with a color-coded overlay representing a climate model. The 'Databases' panel on the left lists various data sources like 'Euterpe_edulis_63', 'prec1', 'prec7', 'teste2_Euterpe_edulis_h', 'tmax1', 'tmax7', and 'tmin1'. The 'Views/Themes' panel shows a hierarchical view of layers, including 'BR_UFs', 'Eedulis_LL_WGS84', and 'model'. The 'TerraView openModeller Plugin' dialog box is open, showing 'Environmental and Landscape Layers' selected for both 'Model Building' and 'Model Projection'. The 'Output' section shows 'Layer name: teste2' and 'Directory: D:/Oficina_OM/Modelos'.

are used.

Environmental Data

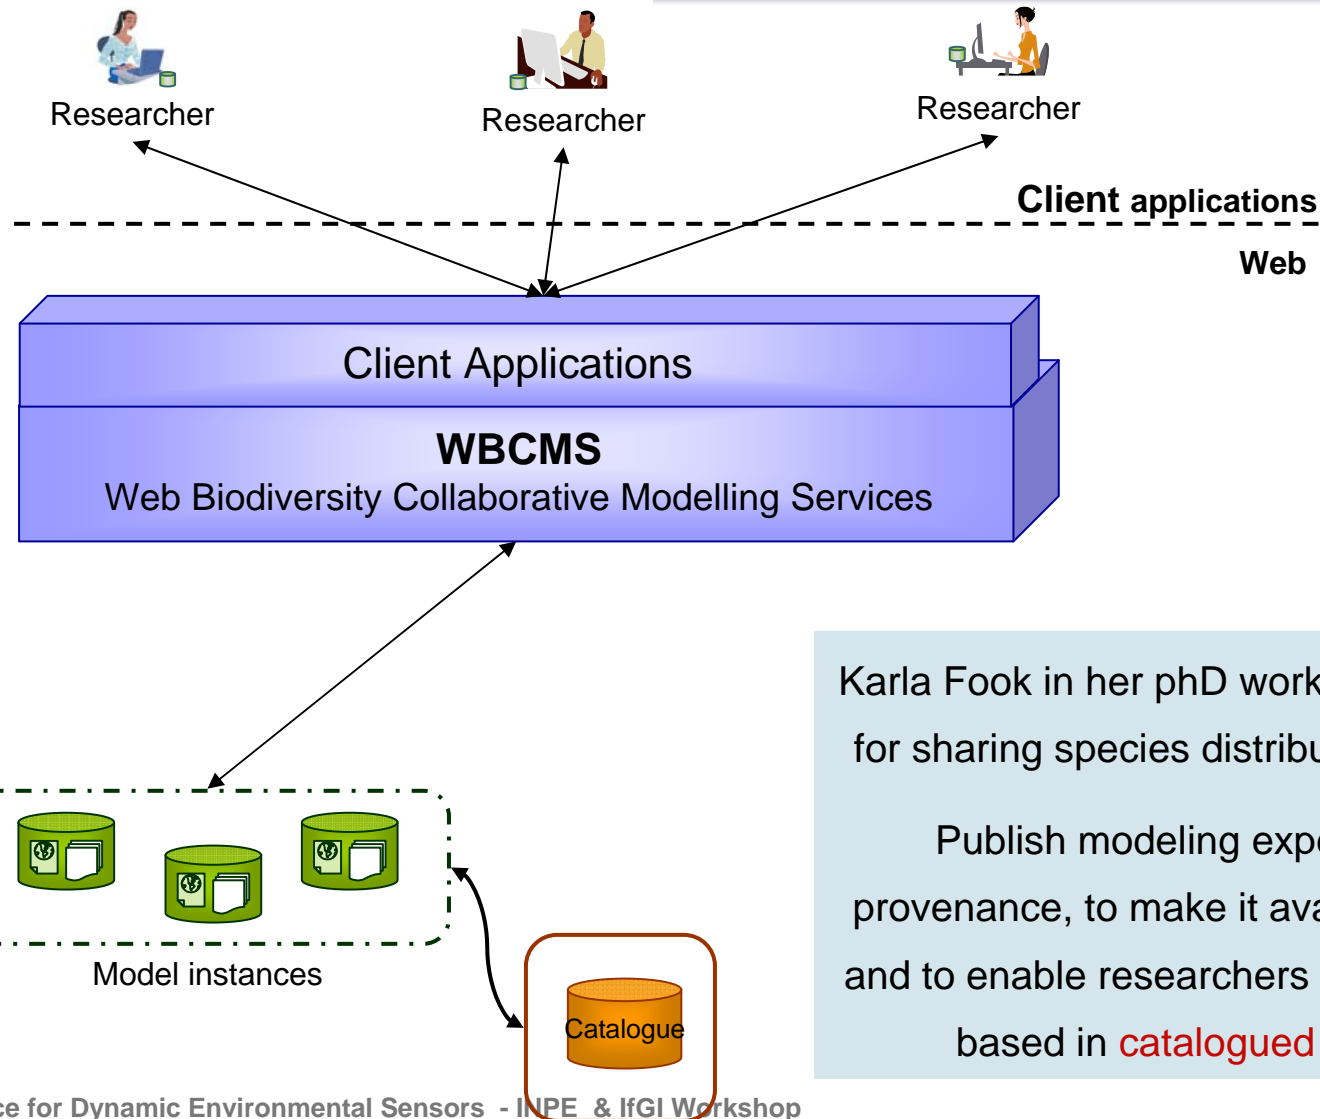

Alexandre Jardim is a Master student, working on creating a *Web Environmental Catalogue Service*:

- an ontology for environmental data for the domain of SDM
- a WS that identifies data sources exporting data as WCS; makes a mapping between its metadata and the SDM ontology
- a client interface to the WECS and openModeller
- evaluate the WCS specification for the SDM domain

Sharing modeling experience

Karla Fook in her PhD work proposes an approach for sharing species distribution modeling on Web

Publish modeling experiments and their provenance, to make it available into catalogues, and to enable researchers to perform new models based in **catalogued model instances**

Model Sensibility to input data positioning errors

- Fundamental Niche simulation: Non-restrict distribution, continuous, and typical from Amazon
 - 100 “GPS” points
- Positioning error simulation
 - Cell centroid
 - Polar coordinates
 - Errors up to 10 km; 0,25°; 0,5°; 1°

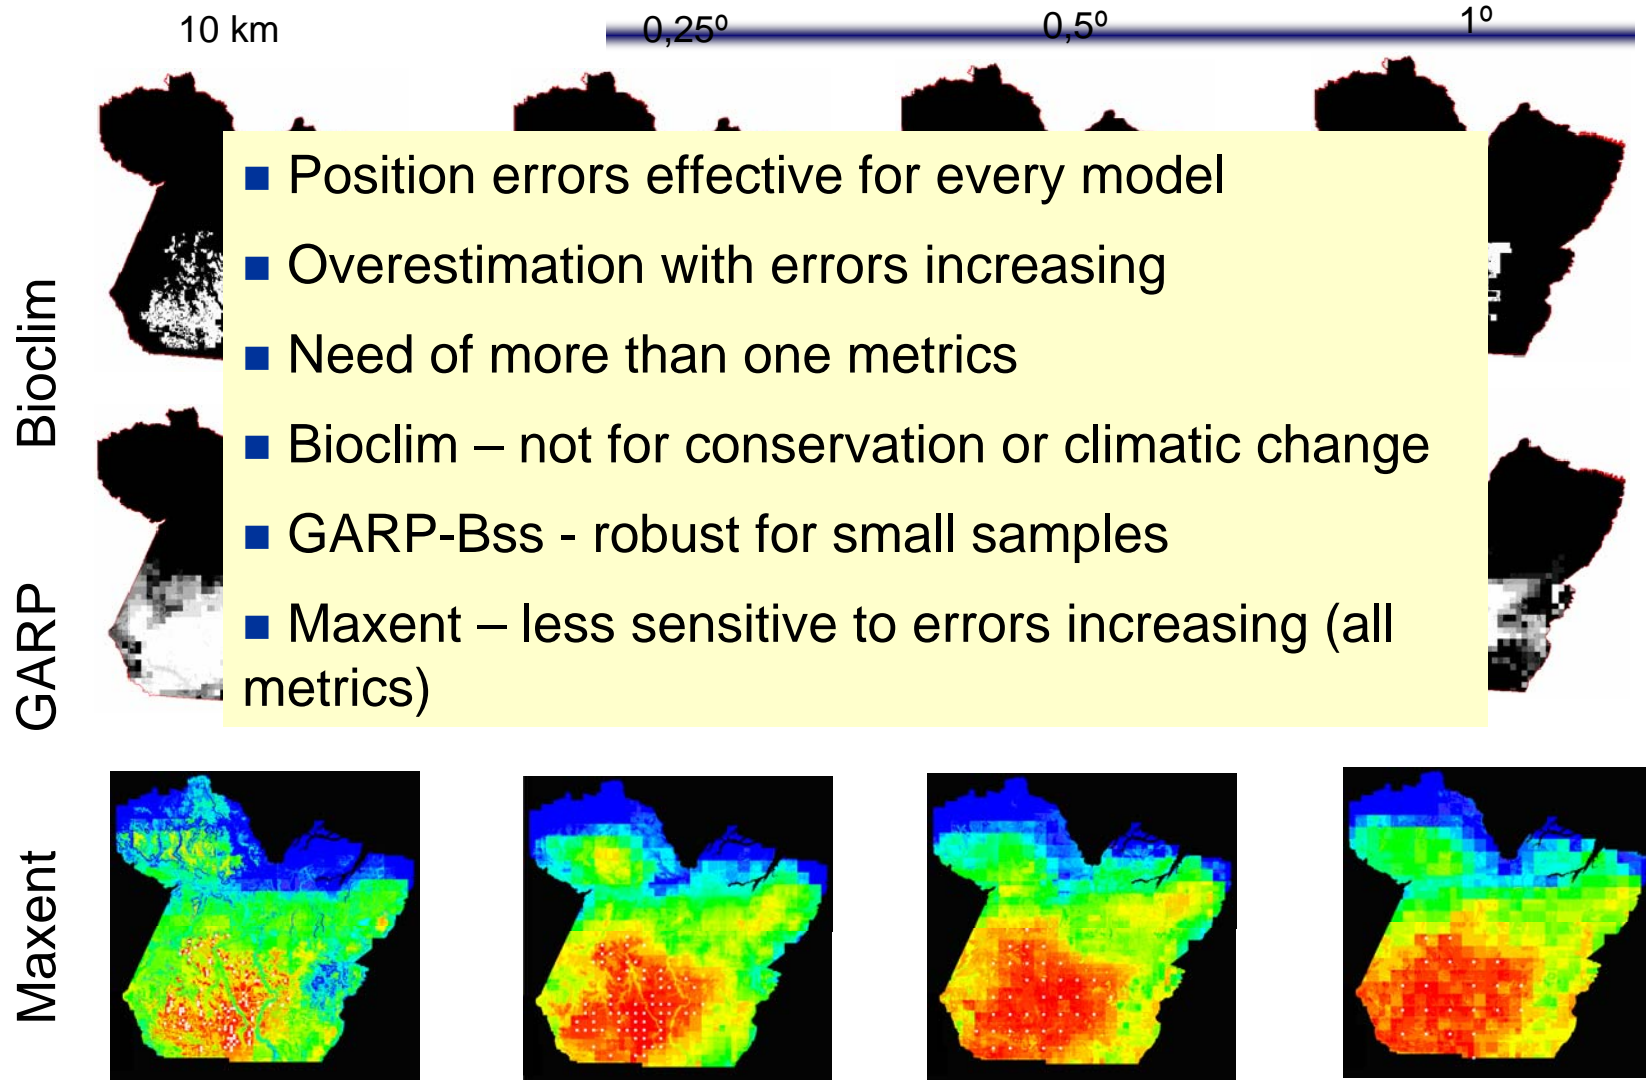

Fábio Iwashita – MsC

Biodiversity Modeling

Habitat loss, changes & threats

- Priority areas for biodiversity conservation

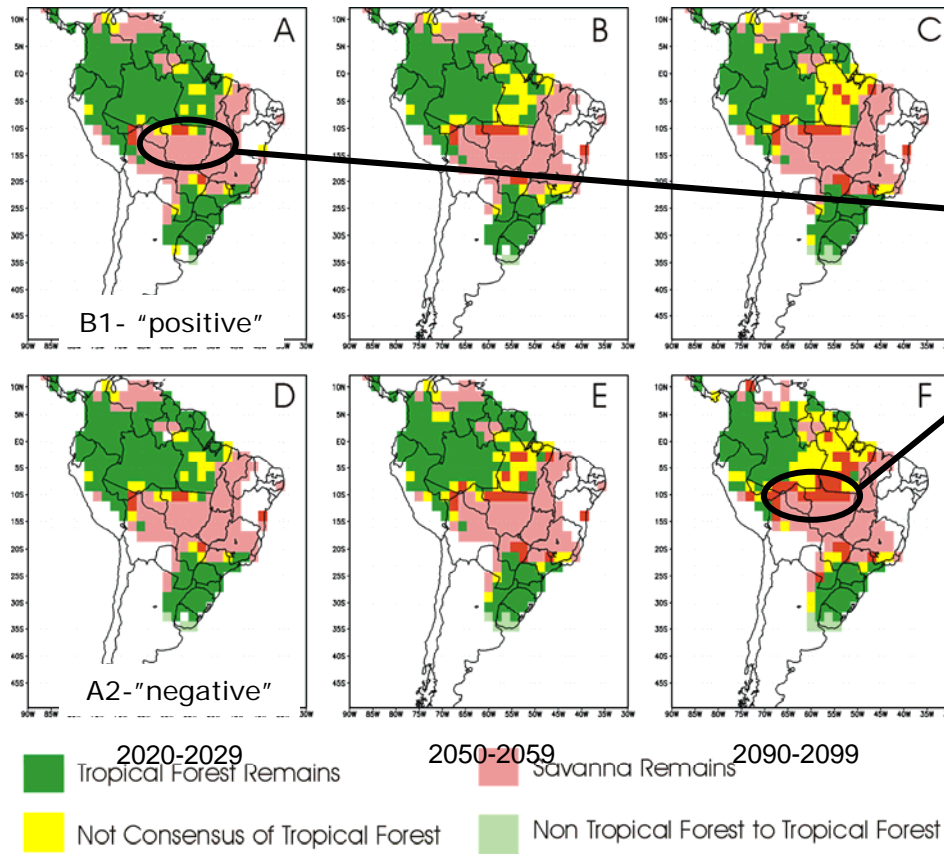

- Deforestation process

Global Climate Change Modelling

- Modeling Biodiversity based on Life Form

- “Savanization” process

BIOMA approach

?? Given the climate warming and based on the plant form spectra, is there a tendency of "savannization" of Amazonian forest ?

Modeling Biodiversity based on Life Form

- Potential life forms combination over cerrado and Amazon forest frontier considering scenarios of climate change
- Modeling based on bio-climatic envelopes and life forms

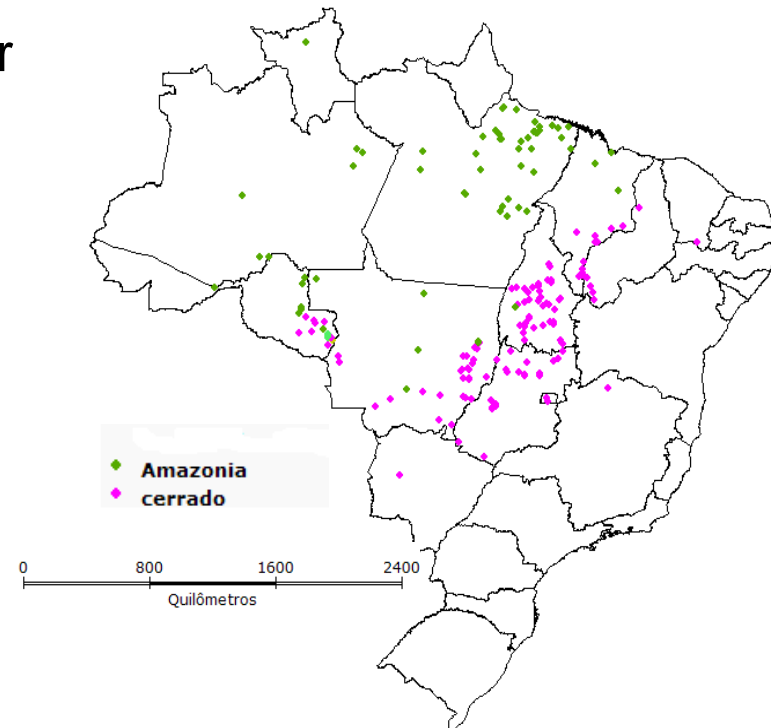

Height

Specific Leaf Area (AFE)

Species classified based on the Function instead of taxonomy – Functional GROUPS

Species grouped by their form of life and survival strategy & E.Box Model

Final Comments

■ Biodiversity modeling

- Important Issue in times of Global Change
- More questions/problems than solutions/answers
- Complementary Approaches – every contribution is more than welcome !!
- Understanding temporal (“slow”?) and spatial (“too diverse”?) Biodiversity dynamic
- Modeling – despite the restrictions, one can learn from modeling exercises.

Thank you !
